

# BURMESE PYTHONS in Florida

## What is a Burmese python?

The Burmese python is a large, nonvenomous constrictor snake that has been introduced to Florida. These snakes threaten the Everglades ecosystem, including native wildlife. They can reproduce in great numbers and eat a wide variety of food items ranging from eggs to small deer.

*Burmese pythons can hide in overgrown vegetation.*

## How to identify a Burmese python

Burmese pythons are tan in color with dark “giraffe” blotches on the back and sides that are irregularly shaped and fit together tightly like puzzle pieces. Burmese pythons have a dark arrowhead shape on top of their head and a dark wedge behind the eye.

## Burmese python fast facts

- Can grow up to 20 feet in length.
- Average size removed in Florida: 8-10 feet.
- Native to South Asia.
- Females lay about 50-100 eggs per year.
- Can live more than 20 years in captivity.
- Skin pattern provides effective camouflage in landscape, making snakes difficult to see.
- Ambush predators that prey on birds, mammals and reptiles.
- In Florida they can no longer be acquired as personal pets.
- Federal law prohibits import into the country without a federal permit.

*The FWC has documented breeding populations of Burmese pythons in Miami-Dade, Monroe and Collier counties, mainly within and around the Florida Everglades.*

*This map shows credible sightings of Burmese pythons in Florida as of 10/2019.*
